

Why vaccinate?

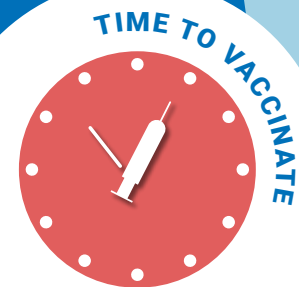

Vaccines help your child fight off serious diseases like measles and whooping cough (pertussis). They've saved millions of children's lives around the world, so why take a risk with your child's health?

So don't delay – contact your healthcare provider to discuss your child's vaccinations!

INFORMATION PORTAL
An initiative of the European Union

Are vaccines safe?

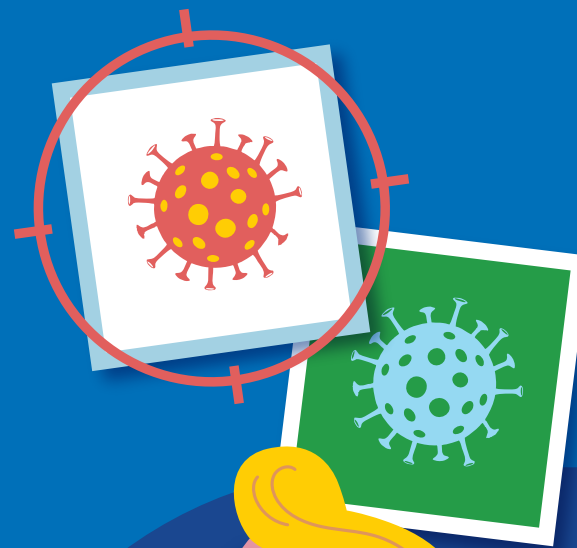

Before they reach you, vaccines go through years of testing to make sure they're safe. And even after that, they're constantly monitored for any potential side effects.

How do vaccines work?

Vaccines teach your child's immune system to create specific antibodies to fight a disease. It is much safer for your immune system to learn how to do this through vaccination, than from catching actual diseases that can lead to serious complications.

Your healthcare provider can give you a detailed vaccination schedule to make sure your child is protected.

What about side effects?

Children may experience mild side effects, like a slight fever or pain or redness at the injection site, but these are usually short-lived.
