

True or **false?**

Vaccination against HPV helps protect against infections that can lead to cancer.

It's true!

HPV is a virus spread through sexual contact.

It increases your chances of developing some types of cancer (cervical, genital, anus, head and neck) and is responsible for over

33,000

new cancer cases in men and women every year.

But there's good news!

A safe, effective vaccine is available across Europe.

It will help protect you against HPV and the risk of cancer.

Widespread vaccination could prevent **90%** of all cervical cancers **by 2030.**
